

Photovoltaic Simulators

PVS series

PVS 1000/LV

The High Speed Simulators

The relating standards:
IEC/EN 50530
IEC/EN 62116
VDE 0126-2
IEEE 1547

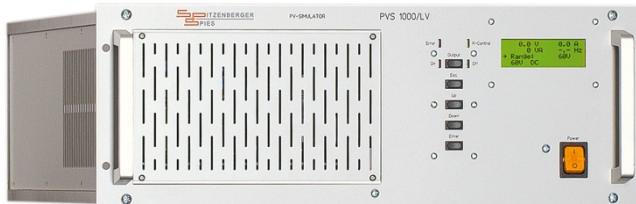

Fig. 1: PVS 1000/LV

- ✓ Free programmable I/V characteristics
- ✓ Different solar cells and also partly shadowed PV-generators can be simulated.
- ✓ Fast response time to load changes:
typical less than 100µs
- ✓ 100Hz ripple on current and voltage of single phase inverters is reproduced realistically
- ✓ The I/V curve is simulated very accurately
- ✓ Ability to simulate dynamic irradiance and temperature, possibility of simulation of the behaviour of a PV-generator during a typical cloudy or clear day
- ✓ Evaluation of static and dynamic MPP-tracking efficiency
- ✓ Complies with the requirements according to IEC/EN 50530
- ✓ Available in standard version (up to 950V_{DC}) and low-voltage version (up to 150V_{DC}) for micro inverter testing

Fig. 2: PVS 25000

THE PV-SIMULATOR – FIELD OF APPLICATION

The PV-Simulator reproduces in real time the behaviour of many different solar panels.

The parameters influencing this behaviour in reality are the changing weather conditions, the variation of the irradiation during the day and also local conditions like shadowing and pollution. To simulate this condition the PVS has a capability for fast control adjustments.

Fast response time

Due to the fast DSP based regulation system, the response time to load changes is very fast. For the IEC/EN 50530 and the specified MPP tracking algorithm this fast response time is absolutely necessary.

See Spitzenberger & Spies Application note under:
<http://www.spitzenberger.de/weblink/1005>

The diagrams in Fig. 3-6 show the measured rise- and fall-times at different load conditions.

Load changes around MPP:

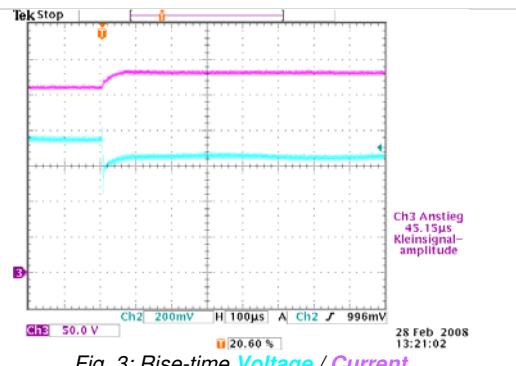

Fig. 3: Rise-time Voltage / Current

Load between open circuit and MPP:

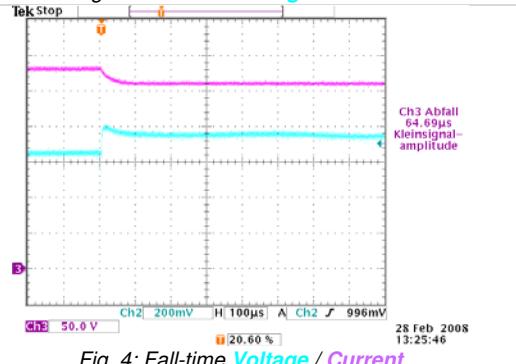

Fig. 4: Fall-time Voltage / Current

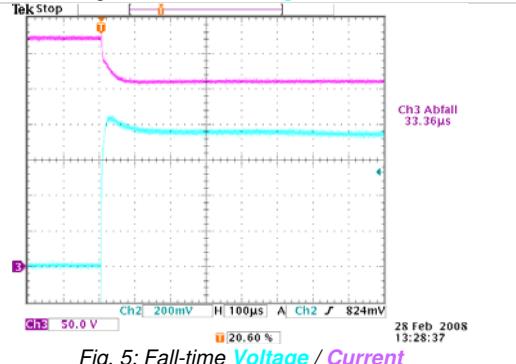

Fig. 5: Fall-time Voltage / Current

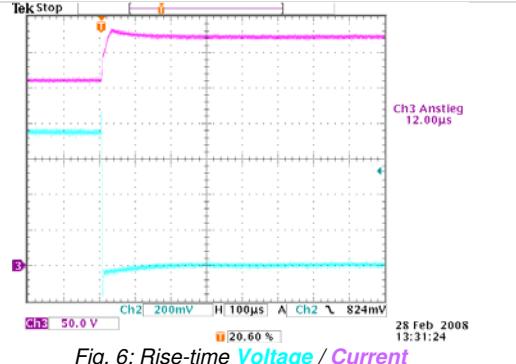

Fig. 6: Rise-time Voltage / Current

100HZ RIPPLE / FREE PROGRAMMABLE CURVES

100Hz Ripple

One of the requirements of the photovoltaic simulator according to the IEC/EN 50530 is:

"This requires a sufficient dynamic of the PV simulator in order to follow the dynamic voltage changes that occur in the measurement (e.g. the typical ripple of single phase inverters with twice the grid frequency)"

With real photovoltaic generators this typical 100Hz ripple on current and voltage when operating with a single phase inverter can be measured. Some inverters use this for a fast MPP tracking.

When operating with the PV-Simulator this ripple-behaviour is exactly as it is in reality, because of the very fast response time capability.

Free programmable curves

I/V-curves are adjustable via software over a wide range to simulate various conditions for dynamic irradiances and temperature changes. This includes "in the field" measured I/V curves, stored and imported into the Spitzenberger & Spies control software.

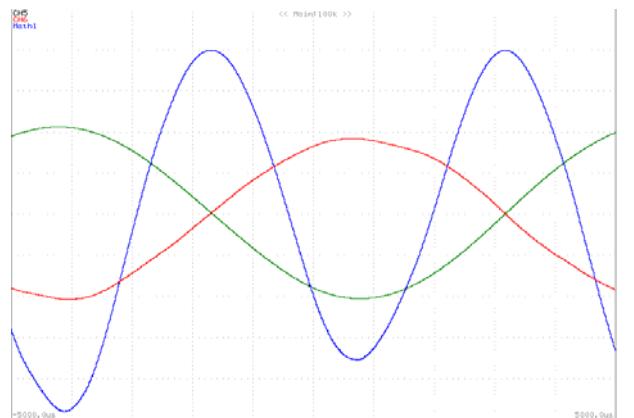

Fig. 7: 100Hz ripple of voltage and current - **voltage, current, power**

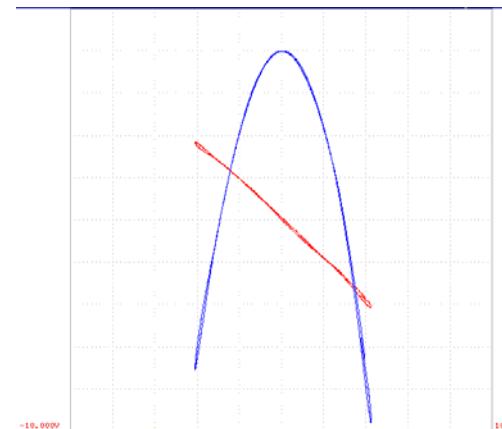

Fig. 8: XY-view: no hysteresis observably - **current, power**

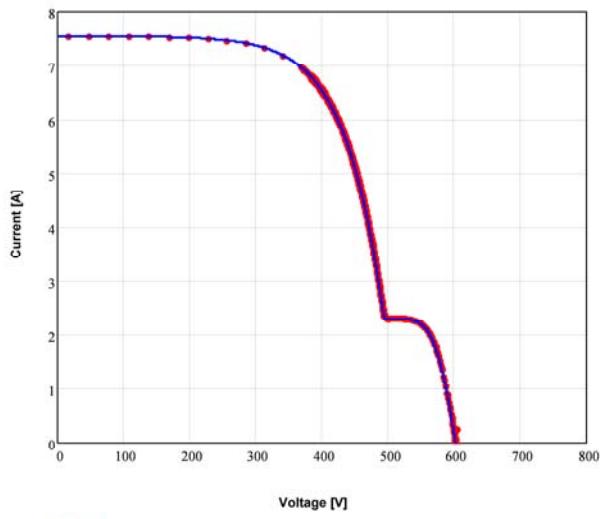

Fig. 9: free programmable I/V curves

SIMULATION OF DYNAMIC IRRADIATION

Irradiation

The intensity of the solar radiation density – the irradiation – is varying during the day.

Slow variations occur because of the changing position of the sun.

Fast variations can occur at cloudy days, when the sun is shadowed within seconds and cleared some minutes later and again shadowed.

Various curves – corresponding to different irradiance - can be defined with specified time course.

Transition between two curves will be interpolated; the transition time is freely programmable.

The specified curves are met exactly during the complete measurement duration.

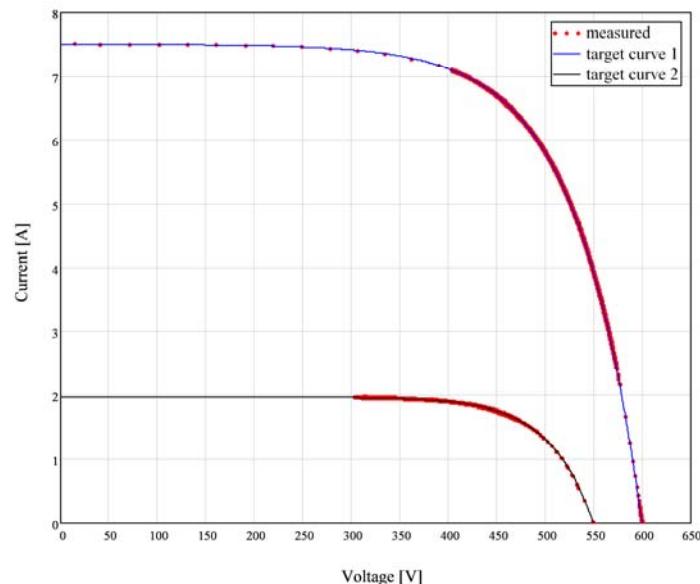

Fig. 10: various I/V curves

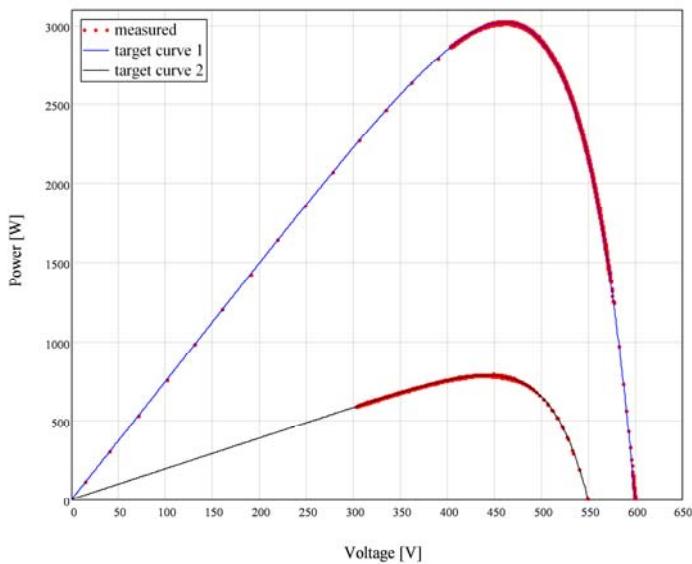

Fig. 11: various V/P curves

VOLTAGE RANGES – CURRENT CHARACTERISTICS

Due to different types of solar generators the PVS standard series has five voltage ranges:

- 400V
- 500V
- 600V
- 800V
- 950V

The diagrams show the maximum possible current capability in the according voltage ranges, depending on the adjusted output voltage. This correlates also to the maximum available power capability of the PVS depending on the adjusted output voltage.

The current capability of the PVS is specified as:

- **Continuous current capability**
- **Short time current capability**
(up to 2 minutes)
- **Peak current capability**
(up to 50ms)

TECHNICAL DATA – GENERAL

PVS Series		
Nominal voltage	<i>DC:</i>	+400V _{DC} / +500V _{DC} / +600V _{DC} / +800V _{DC} / +950V _{DC}
Voltage accuracy:		0,2% / 0,5% (typ. / max.) upper range value
Current accuracy:		0,2% / 0,5% (typ. / max.) upper range value
Slew rate:		< 250µs / typical < 100µs
Protection circuits:		Overload / Short Circuit / Over temperature
Interface:		IEEE488
Measurement (via Software)	<i>Voltage:</i>	0.1V resolution
	<i>Current:</i>	0.01A resolution
	<i>Power:</i>	1W resolution
Memory capacity for I/V curves:		up to 1024 curves
Ambient temperature:		0 °C up to 40 °C

Options		
10:	Internal resistance compensation	available
11	Special voltage	
11-200/DC	Additional DC voltage range	0 ... 200V _{DC}
18	Special line voltages	In the range from 110V ... 300V
	Precision Power Analyser for efficiency measurement	

Remarks:

- 1) at nominal voltage
- 2) max. voltage between earth and ground of the amplifier output -950V_{DC}, +400V_{DC}
- 3) to increase the output power of an amplifier, up to three similar amplifiers may be connected in parallel
- 4) with measurement adaptation to PAS
- 5) at 230V input voltage
- 6) max. / typ. (of measured value ±2 digit)
